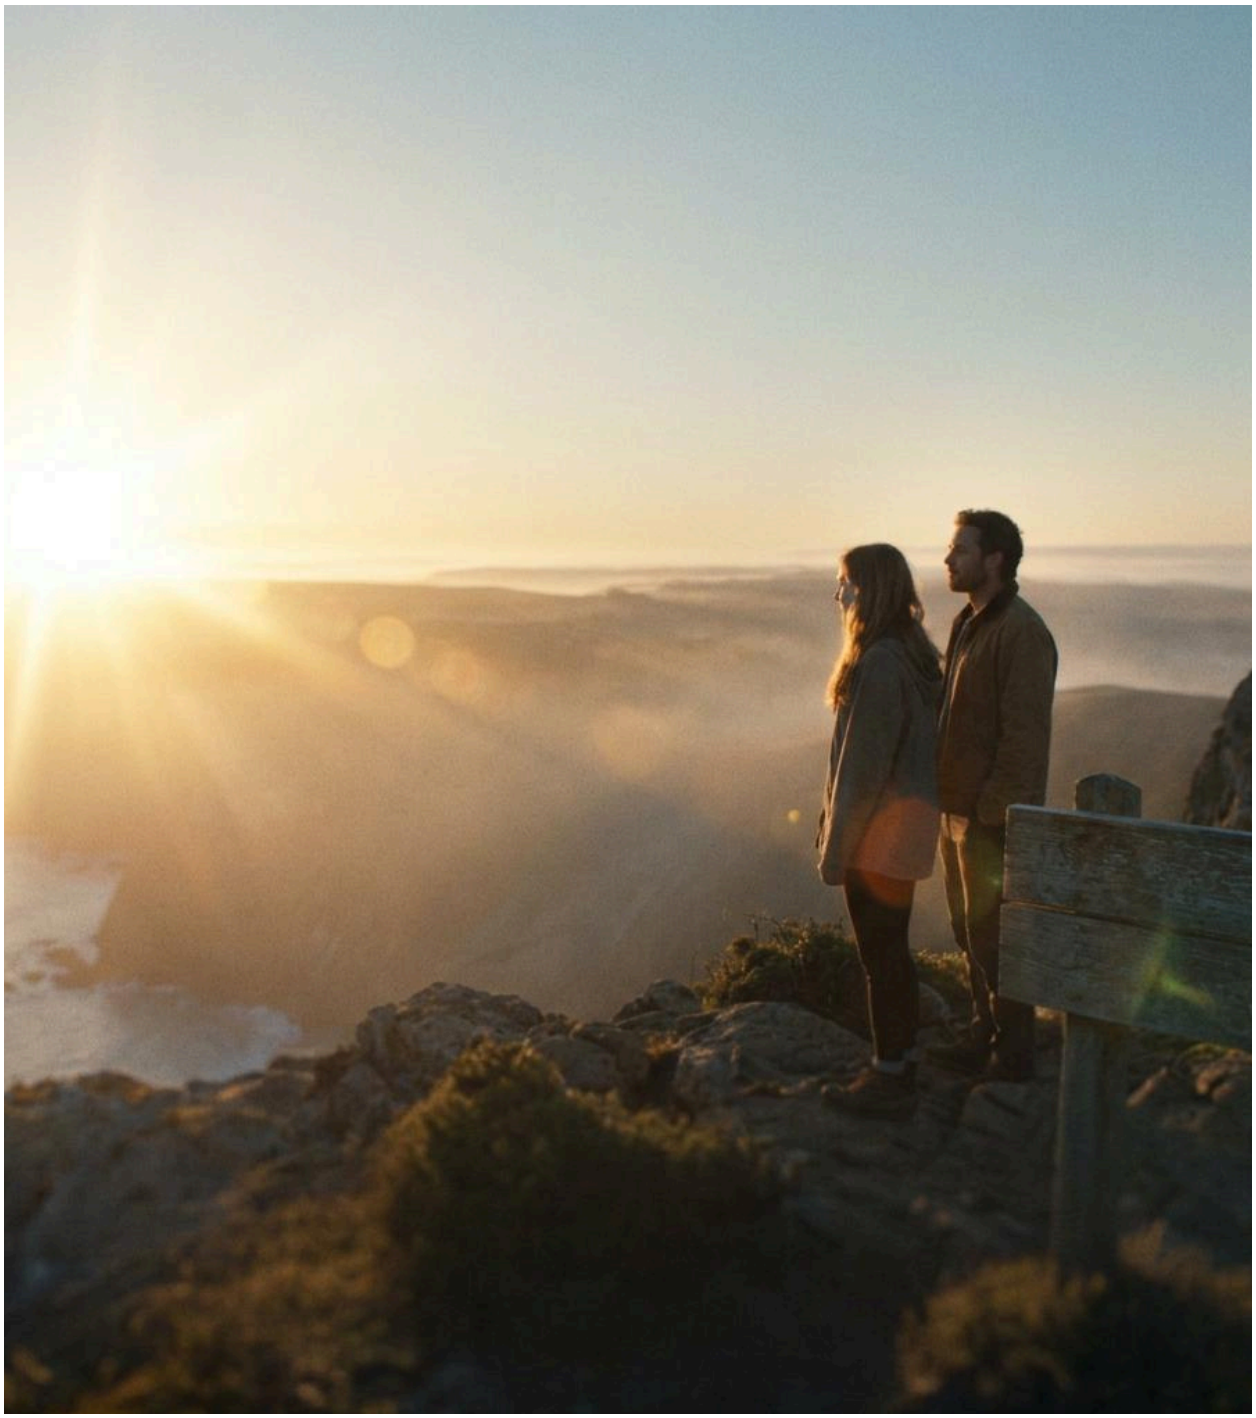
The HAL Flow-Through Core Activation Material

The 3-7 Level Core Activation Work in 2027

Produced by Randi Green © September 2026



Introduction

Our world is changing, our internal architecture is changing and the sun is changing.

These are the key stone building blocks that we are operating within as part of the current reality field configuration. As we move into 2027, the solar system will technically no longer be under the holocene configuration of the colonial groups.

This is not a good thing for us.....just wanted to make sure you understand that this is not the whole "ohh here the savior races come and help us" narrative. Instead it will force us into an exponential rapid NGC Activation and Cleanup process.

Our sector will change into the hybrid configuration that will support the last leg of the Universal Matrix Project to build a new version of the Less Progressive Universal structure into a new formation that will carry the grids and networks needed to support the Universal Matrix in the 4th and 5th dimension. This hybrid configuration is under the control of the new kids on the block that have grown out of the regressed colonial groups and their affiliates.

The Universal Matrix 4th dimension (UM4D) is governed by what is left of the 3 lineages that have regressed into combinations of insectoid, avian, reptoid and mammal combinations. The continuation of their existence is secured via the hybrid templates and hybrid programs.

The Universal Matrix 5th dimension (UM5D) is governed by the humanoid of the original LPU lineages, which joined the 3 regressed lineages at the time of the Atlantean colonies.

These ancient Atlantean human-humanoid groups are part of the Transnational Regenesis Programs deployed all over our world, and have been doing so since the colonization of our solar system.

The Atlantean groups were granted the old 5th dimension by the D10 Dracos some 26,000 years ago with all of its cube technology and the allowance to run their own parallel programs.

In our time, these programs are called the Star Seed Programs in exchange for overseeing the colonial technologies in the 4th dimension. In the Universal Matrix they will again sit on the top of the hierarchy and ensure the programs run as needed within the new worlds of the universal matrix. The Universal Matrix (UM) or OM as it is also called the Otherworldly Matrix.

The Er´Th Scheme Configuration **28**

The Transition into the Universal Matrix

As we move toward 2027, we enter a transition that, within the HAL Framework, cannot be understood simply as another period of social, political, technological, or planetary change. It represents a larger systemic reconfiguration.

The premise explored in this material is that our solar system has operated for a very long time within a particular configuration of colonial structures, technologies, lineages, grids, and programs. This configuration has shaped not only the physical development of humanity but also the deeper template environments through which different forms of life, awareness, and technological systems have interacted.

In 2027, the period associated with the Holocene is going through the last phase of the bifurcation of our reality field and the final operational period of the colonial configuration.

As this configuration reaches its conclusion, the solar system moves into what can be described as a hybrid-enhanced configuration. This does not mean that one world simply ends and another begins overnight. Large systems rarely operate in such a linear manner. Old structures continue to function while new structures are established. Existing technologies are repurposed. Older grids become incorporated into new networks. Some programs terminate, while others are transferred into new operational environments.

The transition is therefore better understood as a process of systemic conversion.

By 2027, the older configuration will no longer function as the primary architecture governing the solar system. Instead, the underlying infrastructure will increasingly support the next phase of what we call *the Universal Matrix Project*.

This section establishes the foundational cosmological structure necessary for understanding the rest of the course.

Understanding the Process of Systemic Conversion

When we speak about *a process of systemic conversion*, we are describing something much larger than ordinary change.

A system can change while fundamentally remaining the same system. It can update its technologies, replace individuals, alter its rules, or expand into new territories without changing its underlying architecture. A systemic conversion is different. It occurs when the existing architecture itself is progressively reorganized so that it can perform a different function, support a different hierarchy, and operate within a new overall structure.

This is important for understanding the conversion of systems. The old colonial configuration has been replaced by the, now complete, Universal Matrix. This means that the existing system is completing a period from 2011 to 2027 where infrastructures, populations, technologies, grids, programs, and template structures were reassigned, reorganized,

dismantled, or incorporated into the emerging configuration. And in this process, the old colonial overlay technologies functioned as the raw material for the new one.

Conversion Rather Than Replacement

The easiest way to imagine systemic conversion is to think of an old building being adapted into a completely different type of facility. The building itself may remain standing. Some rooms remain usable. The foundations may still be intact. Electrical systems, transport routes, storage areas, and communication networks may continue operating.

But internally, almost everything is being reorganized:

- Rooms receive new functions.
- Old walls are removed.
- New connections are established.
- Some sections are permanently closed.
- New technologies are installed.
- The people using the building may change.
- Most importantly, the building is no longer organized around its previous purpose.

For a period of time, from 2011 to 2027, both realities existed simultaneously. The old structure had not entirely disappeared, while the new structure was being built within and around it. This is the principle of systemic conversion.

The implementation, from 2000 and onward, of the hybrid templates and organic vessels was therefore part of a large-scale process toward a Universal Matrix hybrid configuration and thus not the destruction of the old colonial system followed by the creation of an entirely separate system.

They reached the last phase in 2017 of this process with the Event Program. Much of the existing infrastructure was considered too extensive, too deeply embedded, or too valuable simply to be abandoned. Instead, parts of the old configuration were converted.

- Some technologies were repurposed.
- Some grids were redirected.
- Some populations were transferred into new program structures.
- Some template systems were modified to become compatible with the new matrix.

Other structures no longer had a function and were gradually phased out. The result was a prolonged overlap between what was ending and what was beginning.

The Five Levels of Systemic Conversion

Systemic conversion can be understood as taking place simultaneously across several levels.

1. Conversion of Infrastructure

The first level concerns the underlying infrastructure. Every large system depends upon structures that make its operation possible. These can include grids, networks, dimensional environments, technological interfaces, information systems, and mechanisms that connect one operational level with another. During the systemic conversion, these infrastructures did not necessarily disappear. Their function changed. A grid that previously supported one colonial program was redirected to support a hybrid continuation program.

A technological environment originally constructed for population control, regeneration, or template management was integrated into the infrastructure of the new Universal Matrix.

The same structure therefore remains physically or energetically present while serving an entirely different purpose. For the observer, this is one reason why transitions can be difficult to recognize. We tend to look for visible disappearance. But conversion often happens through functional reassignment.

The question is not only: "*Does the infrastructure still exist?*"
The more important question becomes: "*What is the infrastructure being used for now?*"

2. Conversion of Programs

The second level concerns the programs operating within the system. The colonial configuration contained multiple programs developed during different periods and for different purposes. Some were connected to settlement. Some to regeneration. Some to lineage continuation. Some to hybridization. Some to technological oversight.

As the larger system was converted, these programs were also evaluated according to their future usefulness. Some programs were terminated because their original purpose had been completed.

Others were merged into the Universal Matrix. Several older programs became components of a larger program. A program that originally operated independently was brought under new administration.

And some programs continued almost unchanged because they still performed a function required by the new matrix. This means that the systemic conversion was not experienced as a sudden event. For many of the structures involved, there were no moments of ending.

The program simply receives new parameters.

- Its operational territory changes.
- Its hierarchy changes.
- Its output is redirected toward another objective.

What appears to be continuity may therefore contain a fundamental change at the level of purpose.

3. Conversion of Populations and Templates

The third level concerns the populations living or operating within the system. A systemic conversion cannot be accomplished only by changing technology. The populations connected to that technology must also be able to continue within the new environment. This is where hybrid templates become particularly important.

Within the model developed in this course, some of the older lineages can no longer continue solely through their original organic or template configurations. Their histories have involved regression, modification, adaptation, and increasing dependence upon technological support. The hybrid template is the conversion mechanism for the Universal Matrix Groups.

The hybrid enables information from an older lineage to continue within a new structure. Instead of asking whether the original form can be restored, the system asks whether enough of its essential information, functions, and capacities can be transferred into a viable future configuration.

The hybrid structure therefore acts as a bridge between systems. It carries something from the past into an environment that belongs to the future. This is systemic conversion at the level of the population. The original population does not necessarily remain unchanged. It is progressively reorganized so that it can function under new environmental and technological conditions.

4. Conversion of Hierarchy

Every large system also contains a hierarchy. Different groups have different levels of access to information, technology, territory, and decision-making. During the systemic conversion, this hierarchy was reorganized. Groups that were once central may lose their function.

Groups that previously operated in parallel were integrated into a new command structure. Older agreements were replaced by new arrangements. This is particularly significant in the transition from the old colonial configuration to the Universal Matrix.

The Universal Matrix has reorganized the relationship between the hybrid populations of the 4th-dimensional environment and the human-humanoid populations connected to the older LPU structures and 5th-dimensional infrastructure.

The conversion is therefore not only technological. It is also administrative. The question becomes: "*Who has the capacity to operate the new system?*" The answer depends upon access to the technologies, templates, inherited infrastructures, and program knowledge required for the new matrix.

From this perspective, the re-emergence of an older hierarchy does not mean that the old system has simply returned. The hierarchy is being placed into a new architecture. Its position may be familiar, but its function has changed.

5. Conversion of Purpose

The deepest level of systemic conversion concerns purpose. This is ultimately what distinguishes conversion from ordinary change. A system can retain many of its original components while becoming part of something with a fundamentally different objective.

The old colonial configuration was organized around the requirements of the colonial period. Its infrastructures supported the settlement, management, development, experimentation, continuation, and administration of different groups within the solar system.

The emerging hybrid configuration has another purpose. It is designed to support the final formation of the Universal Matrix. This means that existing components are increasingly evaluated according to one central question: "*Can this component contribute to the future matrix?*"

- If the answer is yes, it may be converted and integrated.
- If it can function only under the conditions of the old system, it may gradually lose relevance.
- If it contains important information but cannot continue in its existing form, its information may be transferred into a hybrid or technological structure.

This is the logic of systemic conversion. The components do not determine the future. The requirements of the emerging system determine which components can continue.

The Overlap Period

One of the most confusing aspects of systemic conversion is the period of overlap. During this period, the old system and the new system coexist.

However, they do not coexist as two completely independent realities. They are interconnected.

- The new system is partly built from the old one.
- The old system may continue functioning because the new system still requires certain components from it.
- Some structures may appear stable even though their long-term purpose has already changed.
- Other structures may become increasingly unstable because they are no longer compatible with the emerging architecture.

For us, this is a crucial point. A systemic transition should not necessarily be identified by looking for a single dramatic event. It is instead recognized through changing relationships between systems.

For example:

- An old network may still exist, but fewer resources are directed toward maintaining it.
- A program may still operate, but its objectives gradually change.
- A population may continue to exist, but its future is increasingly dependent upon hybridization or technological integration.
- An old hierarchy may remain visible while decision-making is transferred elsewhere.
- A technological system may appear to be expanding while its underlying function is being redirected toward a new matrix.

In each case, continuity exists on the surface. But conversion is taking place underneath. This is why the transition can be misunderstood if we only ask whether something has ended. A more useful question is: "*Has the function of this system changed?*"

Conversion Does Not Require Universal Awareness

Another important feature of systemic conversion is that not everyone within the system needs to understand that the conversion has taken place. A large-scale system can change direction without every participant receiving a complete explanation.

- Individuals continue performing their roles.
- Organizations continue operating.
- Programs continue producing results.
- Technologies continue being used.

Yet the larger relationships between these components may be changing. Within the HAL Framework, this is particularly relevant in our inner work.

Humanity will continue to experience history through familiar social, cultural, economic, and technological processes while larger template and matrix structures undergo reorganization. This does not require every human being to consciously participate in the conversion. From a systemic perspective, individuals can be components of a changing environment without possessing a complete map of that environment.

This distinction is important throughout this course. Personal awareness of a process and systemic participation in that process are not the same thing. A person may become aware of the transition. Another person may not. Both may nevertheless live within the same changing architecture.

Why the Process Is Hybrid

The emerging configuration is described as hybrid because it does not begin from a completely new foundation. It combines different histories.

- Old and new technologies coexist.
- Biological and technological continuation strategies intersect.
- Regressed and more original lineage structures occupy different positions.
- Inherited dimensional infrastructures are incorporated into newly developing networks.

The hybrid-enhancement configuration was therefore a solution to a practical systemic problem. The system cannot simply return to its original state because too much has changed. Nor can it completely discard its past because the past contains the infrastructures and populations required to construct the future. It must combine them.

The new system therefore carries several temporal layers simultaneously.

- It contains ancient infrastructure.
- It contains technologies developed during the colonial period.
- It contains hybrid templates created to solve later problems of lineage continuation.
- And it contains newly forming structures designed for the future Universal Matrix.

The emerging configuration is thus neither entirely ancient nor entirely new. It is a composite system. This is the essence of the hybrid conversion.

Systemic Conversion as a Transfer Process

We can therefore understand the entire conversion as a process of transfer running parallely with the New Grand Cycle activation and cleanup processes of the Restoration Program. As the foundation of the original construction behind our solar system dissipates, the Universal Materix has taken over our solar system in the 4th to 5th dimension. The old colonial artificial 4th and 5th dimensions have been merged into the Universal Matrix which is one of the key reasons why the old colonial D4 to D10 groups are no longer present.

- Information was transferred from old programs into the new ones.
- Functions were transferred from obsolete infrastructures into newer networks.
- Lineage information was transferred into hybrid templates.
- Administrative authority was transferred into a reorganized hierarchy.
- Technologies were transferred from the colonial environment into the Universal Matrix.

And, ultimately, the solar system itself was transferred from one larger configuration into another. This transfer did not happen instantaneously. Different components moved at different speeds. Some structures already operate according to the new configuration while others remain deeply embedded in the old one. This creates uneven development.

The transition has therefore contained periods of apparent contradiction. Both the transition period of the New Grand Cycle processes and the emerging Universal Matrix formation.

An emerging system can look highly advanced in one area while relying upon extremely old infrastructure in another. A new hierarchy can develop while the previous hierarchy remains publicly or operationally visible. New technologies can be introduced while older technologies continue to provide the foundation underneath. These contradictions are not necessarily signs that the conversion has failed. They may be characteristics of the conversion process itself.

Our Position Within the Conversion

For the purpose of this course, the concept of systemic conversion provides a way of approaching the years ahead without expecting the conversion to conform to ordinary ideas of change. We are not necessarily looking for a date when one reality vanishes. We are learning to investigate structural shifts.

We ask:

- What systems are losing their original purpose?

- What infrastructures are being maintained, and why?
- What technologies appear to be changing function?
- Which populations require new continuation strategies?
- Where are hybrid structures becoming increasingly important?
- What older programs appear to be incorporated into larger networks?
- Which hierarchies are being reorganized?

And perhaps most importantly: "*What is the emerging system asking its components to become?*"

These questions allow us to investigate the conversion as a process rather than reduce it to a prediction. Within the HAL Framework, 2027 is therefore not simply presented as a dramatic dividing line between one world and another. It represents an important threshold within a much larger conversion process. The old configuration has reached the point where it can no longer remain the primary architecture for the future. Its components are increasingly being reorganized around the requirements of another system.

That is what is meant by a process of systemic conversion. It is the gradual but fundamental adaptation of an existing architecture in which its infrastructures, programs, populations, templates, technologies, hierarchies, and purposes are reorganized so that they can function as components of a new and larger system. The old system does not disappear. It is progressively adapted into the foundation from which the next system is built.

From the Colonial Configuration to the Hybrid Configuration

The colonial configuration started some 26,000 years ago and ran uninterrupted until 2011. The colonial reality configuration was constructed through successive interventions by different groups, lineages, programs, and technological systems (listen to podcast 1).

Our solar system became part of this hijacked environment in which different dimensional layers of the solar system were refurbished for settlement, experimentation, regeneration, template modification, resource development, and long-term lineage continuation.

The result was not a unified civilization. Rather, it was a layered system. Different groups within the 4D-D10 of our quadrant operated according to different histories. Some retained more of their original organic and template structures. Others underwent different processes of regression, hybridization, technological modification, or adaptation to changing conditions. Some groups became increasingly dependent upon artificial template systems in order to maintain continuity.

Over time, these different histories became embedded within the operational structure of the solar system. However, colonial configurations were not permanent. They depended upon infrastructures that eventually became obsolete, unstable, exhausted, or incompatible with the next stage of development.

The conversion in 2027 therefore represents the last leg of a larger restructuring process.

The purpose of the reality field adaptation processes, of which the newer hybrid programs began in 2000, was to support the final phase of *the restructuring of the Less Progressive Universal structure, or the LPU structure, into the Universal Matrix formation capable of sustaining future grids and networks*. This formation was not simply an extension of the old system.

It was a reconstruction. Specific chosen lineages have been incorporated and adapted via the hybrid technologies. Old technologies have been reused where possible.

The hybrid templates are important because they bridged incompatible organic and technological histories. Artificial dimensions and inherited dimensional infrastructures were reorganized into a new operational hierarchy. The objective was continuity. But it was not continuity through preservation of the original forms. It is continuity through reconfiguration.

Colonial History and Technologies

One of the major turning points was the colonization of our system approximately 26,000–15,000 years ago. During this period, regressed groups associated with the D10 collectives joined forces with groups originating from the D9, D8, and D7 collectives. Through this combined intervention, these groups gained access to structures and technologies that had previously been part of the Restoration Program.

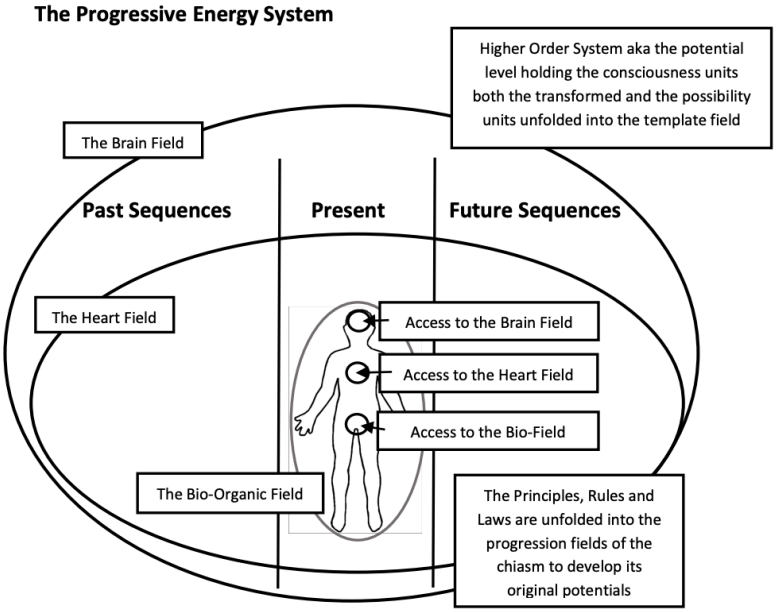
The first intervention was the removal of human access to the 4th and 5th dimensional domains. This significantly altered the relationship between humanity and the higher-order layers of the original system. Once access to these domains was restricted, humanity became increasingly dependent upon the lower-order configurations that remained available within the modified reality environment.

This modified reality environment is called *the Enclosure* (our world and what we can access of the universe) and was positioned in the outskirts of the outer domain (D1-D3).

The colonial groups adapted the technologies, purpose, and functionality of the Restoration Program for their own purposes. What had originally been designed to restore and support the progression of the original templates was progressively repurposed into an architecture

capable of controlling, modifying, and restricting those same templates. A critical part of this intervention involved gaining access to the Pillar Project Library. From this library, the original LPU code configurations (crystal discs) could be accessed and subsequently incorporated into modified systems. The original LPU configurations were not simply preserved in their original form. They were fragmented and inserted into different forms of storyboards and technological structures, where they could be reorganized and combined with artificial timeline technologies.

These became what we refer to as holo-overlays: *additional information structures placed over the original template architecture and used to influence how the template interacted with the surrounding reality field. The result was a progressively layered system*.



The human energy system is built up of different fields composed of codes sequences, energy units and consciousness units.

The original template remained underneath, but increasingly operated through artificial overlays, modified timeline structures, and technological interfaces that altered its access to its original information fields. Holographic-energetic insertion programs (the Chiasm and the 3 Quadrants) were then developed around these modified configurations under the supervision of the Prohibiting Technologies. This began the holocene-colonial programs.

The Universal Matrix Project

The Universal Matrix Project can be understood as an attempt to construct a multi-dimensional environment in which different groups, lineages, templates, and technological systems can continue to operate. Within this framework, the word matrix does not refer merely to an illusion or simulated reality. It refers to an organized operational environment.

A matrix contains the underlying grids through which information can move. It contains networks that connect different locations and populations. It establishes rules of interaction between biological and technological systems. It provides the infrastructure through which templates can be maintained, modified, replicated, or transferred.

The Universal Matrix (UM), therefore, is a large-scale organizational structure. It creates worlds within worlds. Some environments are organic. Some are technological. Some operate through hybrid combinations of organic and artificial systems (semi-organics). Others depend upon dimensional infrastructures inherited from earlier periods. The emerging configuration contains two particularly important operational levels: the Universal Matrix 4th Dimension (UM4D) and the Universal Matrix 5th Dimension (UM5D).

These should not be understood as spiritual levels or locations that an individual moves into through personal development because they are also systemic environments. They represent different layers of administration, technological infrastructure, template organization, and population development. The two dimensions have different functions and, significantly, different governing populations.

The Universal Matrix 4th Dimension

The emerging 4th-dimensional Universal Matrix will primarily support the continuation of lineages that have undergone long-term regression and hybridization.

And as we know from my other material, three major lineage structures have progressively moved away from their earlier configurations and into combinations involving insectoid, avian, reptoid, and mammal consciousness and template configurations. It is important to understand what is meant here by regression. In this context, regression refers to a long-term process in which an original lineage progressively loses the ability to maintain its earlier form and must adapt through increasingly modified structures.

A lineage may therefore survive while no longer existing in its original configuration:

- It can continue through hybridization.
- It can preserve specific functional capacities while losing others.

- It can merge biological structures with technological systems.
- It can create replicated templates.
- It can develop artificial regeneration environments.

Eventually, the distinction between the original lineage and its technological continuation may become increasingly difficult to define. This is one of the central problems addressed by the Universal Matrix Project: "*How to ensure the continuation of a lineage when the original template structure no longer independently sustains itself?*"

The answer developed by the older programs was the creation of hybrid templates and hybrid continuation programs.

Hybrid Templates as Continuation Technology

A hybrid template is not merely a mixed organic-energetic organism. Within the HAL Framework, a template is understood as a holographic-energetic organizational architecture containing multiple levels of information. It includes the information fields behind organic potentials, energetic dynamics, genetic structures, memory technology, awareness capacities, technological engineering interfaces, and technological connections.

When an original lineage begins to lose the stability of its foundational structure, elements from other lineages can be introduced. This creates an adapted configuration.

- An *insectoid structure* carries capacities that allow for binding of layers, insertion into collective structures, as well as modification and replication technologies.
- The *avian structure* contributes to different vibratory, resonance and other similar horizontal merging functions.
- *Reptoid structures* provide stability within particular energetic or technological systems.
- *Mammal structures* provide compatibility with the Enclosure organic environments that require increasingly complex organismic integration.

Over long periods, these combinations create new forms. The new form retains information from several older lineages simultaneously. The purpose is not to recreate the original. The purpose is to ensure that something of the original lineage continues.

This is why the hybrid populations are essential to the new 4th dimensional Universal Matrix. They represent the continuation of the regressed lineages where template matrices and their genetics can be replicated and inserted into the Universal Matrix.

The 4th dimension is the continuation environment. It is the level where templates, old and new regeneration programs, modified organisms, and inherited colonial technologies can be organized into stable networks. The new UM4D is fundamentally different from an environment governed by the organic or original lineage identity of the old artificial 4D. It is a post-original environment. Its populations carry histories of adaptation. Their template matrices contain layers from different periods. Their continued existence depends upon the integration of organic and technology.

The Universal Matrix 5th Dimension

Above the operational hierarchy of the hybrid 4th-dimensional environment sits another population structure. The 5th dimensional level of the Universal Matrix is associated with the humanoid populations originating from the original LPU lineages. These humanoid groups did not remain entirely separate from the regressed lineages. At the time of the Atlantean colonial period, they entered into a larger historical convergence with the three regressed lineage structures. This convergence became one of the decisive moments in the development of the later colonial systems.

The 5D humanoid groups brought with them different capacities, histories, and original LPU technological traditions. Their involvement created new opportunities for administration and coordination for the regressed races and established new hierarchies in the LPU sectors.

Over time, certain human-humanoid groups associated with these ancient colonial histories became integrated into what this framework calls the Transnational Regenesis Programs.

These programs were deployed across our world over extended periods of time. Their purpose was not confined to the development of a single population. They operated through multiple locations, groups, technologies, and long-term template processes. The term transnational is used here because these programs extend beyond the boundaries through which modern humanity organizes itself.

Modern nations are comparatively recent structures. The programs described within this model are connected to older systems of population movement, settlement, regeneration, and template administration. Their operational territories were planetary rather than national.

The Atlantean Colonial Period

Within this framework, the Atlantean period represents an important phase in which human-humanoid populations became deeply integrated into the administration of colonial

systems. One of the most important elements of this period was the older 5th dimensional environment and its associated Cube Technology. Approximately 26,000 years ago these groups were granted access to the old 5th dimension by the D10 Draco structures. The arrangement allowed the Atlantean human-humanoid populations to operate parallel programs while maintaining a specific role within the larger colonial hierarchy.

- They could establish their own projects.
- They could develop regeneration systems.
- They could construct independent or semi-independent template programs.

But this autonomy existed within an exchange relationship. In return, they participated in the oversight and management of colonial technologies operating within the artificial 4th dimensional environment from where the Prohibiting and Ourosboros Technologies operate.

This arrangement is important because it explains the division between the two levels.

- *The 4th dimension* contained the complex technological environments required to sustain the old hybrid and regressed populations.
- *The 5th dimension* provided a higher administrative and organizational position from which specific humanoid populations could oversee larger systems.

The relationship was therefore both technological and hierarchical. The humanoid groups became technology overseers, coordinators, and program developers where the 4th dimensional reptoid-mammal and reptoid-avain groups became the controllers and administrators.

Cube Technology and Parallel Programs

The old 5th dimensional Cube Technology contributes an important section of the Universal Matrix infrastructure. The cube technology should be understood as a particular form of dimensional organization. It creates bounded operational environments.

Information, templates, populations, and programs can be maintained within structured fields rather than functioning as entirely open systems. Such structures allow different realities, developmental processes, or technological programs to operate in parallel. This made the old 5th dimensional technologies particularly valuable.

The human-humanoid populations were able to establish parallel projects without necessarily dismantling the larger colonial system. Over time, these programs diversified.

Different groups developed different approaches to regeneration, template continuation, hybridization, and population management. Some of these ancient programs are interpreted in the present day through narratives that the HAL Framework groups under the term Star Seed Programs.

The modern terminology does not necessarily describe the original terminology of the programs themselves. Rather, it represents the contemporary attempt to identify inherited memories, template connections, experiences, and narratives associated with populations believed to have connections beyond ordinary terrestrial history.

Within this framework, the important question is not whether every modern Star Seed narrative describes the same phenomenon. They clearly do not. The important issue is whether some contemporary experiences represent residual interactions with older regeneration and template programs.

This possibility becomes relevant when we consider that the old programs were never designed around the modern categories of science, spirituality, nationality, or personal identity. They were larger systems. Their remnants may therefore appear in fragmented and highly individualized forms.

The New Hierarchy of the Universal Matrix

As the Universal Matrix unfolds its new configuration, the hierarchy of the old system has been re-established in modified form. The hybrid populations associated with the regressed lineages become central to the functioning of the 4th dimensional level of the Universal Matrix. Their template matrices provide the organic and technological continuity required to sustain the underlying worlds.

Above this level, the humanoid populations associated with the original LPU lineages once again occupy a leading administrative position within the 5th dimensional levels of the Universal Matrix.

This does not necessarily mean that every humanoid individual belongs to such a governing structure. Nor does it mean that all human populations share the same history. The HAL Framework distinguishes between present-day humanity and the specific ancient human-humanoid populations connected to inherited colonial programs.

The governing groups are associated with particular program histories. Their position is derived from access to inherited technologies, older dimensional infrastructure, and

long-term regeneration systems. Within the new Universal Matrix, their role is to ensure operational continuity.

- They oversee.
- They coordinate.
- They maintain the larger programs.
- They ensure that the grids and networks required by the matrix continue to function.

This is the essential hierarchy:

- The 4th-dimensional Universal Matrix provides the continuation environment for hybridized and regressed lineage populations.
- The 5th-dimensional Universal Matrix provides a higher organizational environment for the humanoid populations that inherited and maintained the administrative structures of the earlier LPU systems.

Together, these levels form the emerging UM.

The UM and the Otherworldly Matrix

The Universal Matrix, or UM, is also referred to in this material as the OM — the Otherworldly Matrix. The use of two terms reflects two perspectives. From the perspective of system architecture, it is the Universal Matrix. It is a structured network of dimensions, worlds, grids, populations, templates, and programs. From the perspective of present-day humanity, it is otherworldly.

Its primary infrastructures do not originate within the limited historical framework through which modern humanity understands its own civilization. The OM therefore represents the larger environment into which older colonial structures are being reorganized.

- It is not a single place.
- It is not one civilization.
- It is not one species.

It is a matrix of interconnected worlds and operational levels:

- Some parts are inherited from ancient systems.
- Some parts are constructed through new hybrid technologies.
- Some populations continue through biological regeneration.
- Others depend upon artificial templates.
- Some groups hold administrative positions because of their connection to older

infrastructures. Others function as the populations that sustain the underlying worlds.

The result is a complex hierarchy of world-builders, program administrators, hybrid populations, template systems, regeneration technologies, and dimensional infrastructures. This is the system into which the solar system increasingly transitions.

Why 2027 Matters

The importance of 2027 within the HAL Framework lies in its position as a structural threshold. It does not necessarily mean that every visible aspect of the world changes in a single year.

- Human societies may continue according to familiar calendars.
- Governments may remain.
- Technologies may develop incrementally.
- Daily life will still appear to contain continuity.

But at the level of the larger configuration, the underlying direction changes. The old Holocene-colonial arrangement is no longer the primary future trajectory. The solar system increasingly becomes integrated into the hybrid architecture needed for the final stages of the Universal Matrix Project.

This means that the next period must be understood differently from the previous one. We are not simply moving toward a future continuation of the old world. We are moving through a conversion process in which:

- old colonial infrastructures are phased out or repurposed;
- hybrid templates become increasingly important as continuation structures;
- the remaining regressed lineages are secured through hybrid programs;
- 4th-dimensional grids are reorganized into new matrix environments;
- inherited 5th-dimensional infrastructures are re-established around older administrative structures;
- ancient human-humanoid regeneration programs become relevant within the new hierarchy; and
- The overall system becomes part of a larger formation designed to support the continuing development of the Universal Matrix.

The transition therefore concerns architecture. It concerns what kind of system is being built underneath the visible processes of history.

Understanding Humanity Within the Transition

One of the central questions for this course will be where present-day humanity fits within this emerging structure. Humanity cannot automatically be treated as a single unified population. Our biological histories, template histories, technological connections, and developmental potentials may not be identical.

The HAL Framework therefore approaches humanity as a complex convergence of multiple historical and template processes.

- Some aspects of humanity may be connected to the old regeneration programs.
- Some may carry inherited hybrid structures.
- Some may remain primarily connected to the biological development of the Earth itself.
- Some may have stronger connections to the technological systems that have operated throughout the colonial period.

The purpose of this course is not to assign individuals to simplistic categories. The purpose is to develop a deeper model for understanding how different systems may intersect within the transition. The most important distinction is between being part of a system and becoming aware of the system.

- A person can participate in a larger template environment without understanding its history.
- A population can carry information inherited from older programs without consciously remembering those programs.
- A technological structure can continue to operate after the civilization that originally constructed it has disappeared.

This is why the HAL Framework places such importance on investigation.

- We begin by mapping the possible structures.
- We distinguish observations from interpretations.
- We identify recurring dynamics.
- We examine how biological, technological, historical, and dimensional models interact.

Only then can we begin to construct a more comprehensive understanding of the transition.

The central principle behind this entire course is therefore simple: *The future is not emerging from one uninterrupted human developmental line*. Within the HAL Framework, it emerges from

the convergence of older lineage histories, colonial technologies, hybrid template systems, regeneration programs, and new matrix infrastructures.

The transition toward 2027 marks the point at which these previously separate histories begin to reorganize into a new formation:

- The old colonial world was based upon fragmentation.
- Different groups operated different programs.
- Different lineages pursued different continuation strategies.
- Different dimensions contained different technological environments.
- The emerging Universal Matrix attempts to integrate these fragmented systems into a new hierarchy.
- The regressed lineages continue through hybridization in the 4th-dimensional matrix.
- The original LPU humanoid lineages and their inherited human-humanoid programs reoccupy a governing position within the 5th-dimensional matrix.

Together, they provide the population structures required to operate the new worlds. This is what we mean by the Universal Matrix. And from the perspective of the human world that has developed within the final phase of the old colonial configuration, it is also the Otherworldly Matrix. The question for the year ahead is: "*What new system is being assembled through the events we are witnessing?*" That is where our investigation begins.

Okay - What Does this Mean to Us?

In 2027 we enter a transition that, within the HAL Framework, cannot be understood simply as another period of social, political, technological, or planetary change. It represents a larger systemic reconfiguration.

The premise is that our solar system has operated for a very long time within a particular configuration of colonial structures, technologies, lineages, grids, and programs. This configuration has shaped not only the physical development of humanity but also the deeper template environments through which different forms of life, awareness, and technological systems have interacted. In 2027, the period associated with the Holocene is going through the last phase of the bifurcation of our reality field and the final operational period of the colonial configuration.

As this configuration reaches its conclusion, the solar system moves into what can be described as a hybrid-enhanced configuration. This does not mean that one world simply

ends and another begins overnight. Large systems rarely operate in such a linear manner. Old structures continue to function while new structures are established. Existing technologies are repurposed. Older grids become incorporated into new networks. Some programs terminate, while others are transferred into new operational environments.

The transition is therefore better understood as a process of systemic conversion.

The Timeline of the Systemic Conversion from 2026-2034

The period from 2026 to 2034 represents the final leg of the systemic conversion. While the Universal Matrix is understood as *structurally complete by 2027*, the completion of the architecture does not mean that every population, technology, grid, program, and reality structure has immediately adapted to it.

The years ahead therefore represent a period of implementation, adjustment, and integration. Older holocene-colonial systems continue to lose their remaining functions, while new networks, technologies, hybrid structures, and organizational patterns increasingly establish themselves within the completed Universal Matrix.

The timeline should not be understood as a series of isolated events occurring on fixed dates. It describes phases in which different aspects of the conversion become increasingly dominant. The movement from 2026 to 2034 is therefore the final stage from systemic completion to operational reality, as the new configuration progressively becomes the environment within which future development takes place.

What Remains of the 2-8 Pillar Work

Now, we cannot overlook that most are still stuck in the adaptation stage of the conversion fields, where they work their way through what remains of the 2-8 Pillar New Grand Cycle Cleanup and Activation processes. However, for those in the conversion to the 5th cycle, these processes are no longer part of the work that we need to do.

Now, this is where many will be fooled and think they are further ahead than they are, and then stop doing the original work—and for those who are transitioned into the UMD4 and UMD5 this is the case. Simply because their templates are being adjusted, wiped or modified to fit the Universal Matrix configuration.

Throughout 2026

Outer Domain 2-8 Pillar of the Restoration Programs began the activation and cleanup processes of the old template configurations associated with the Restoration Programs.

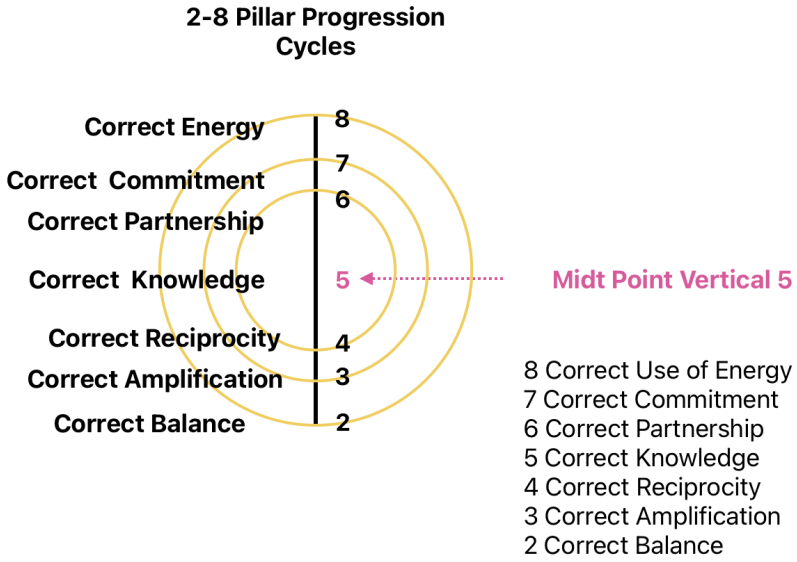
The process went from the 2D (artificial morphogenetics fields) into original 2D (harmonic coherence fields) and from the scattered enclosure 8D to the original 8D (energetic possibility fields) of the 2-8 Pillar. Then the process went into the LPU 2-8D fields as these transitioned to the original 2-8D of the Er´Th configuration.

From 2-8D Level of the Restoration Program → 2-8D LPU → 2-8D Er´Th configuration.

I talk about the Er´Th configuration in my books. This is the reality field configuration aligned with the earliest stages of the less progressive universal (LPU) structure.

Those on the Subsidiary Timeline began the work to reconfigure to the original Er´Th Scheme 9-9-9 configuration of the mind field (9 rings), heart field (9 rings), and bio-field (9 rings) through vortex reconfiguration processes using the ancient Er´Th technologies in the 2nd and 8th dimensions.

Holocene-colonial 2-8 Pillar templates similarly underwent conversion. We had a range of *possibilities* to regain access to our template as part of a larger molecular-energetic transformation process under the NGC. That option closes with the unfolding across 2027 arrangements between the Parallel Universal Matrix groups, the remaining holocene-colonial groups and the Universal Matrix groups.



Throughout 2027 - the Last Chance

Outer Domain 2-8 Pillar of the Restoration Programs continue the activation and cleanup processes of the old template configurations associated with the Restoration Programs but in a limited capacity. The overall system is still in the conversion state and thus there is overlapping between the old and the new. But that changes throughout 2027.

The remaining—and last chance process—goes from the 3D (enclosure fields) to original 3D (participation fields, where we can adapt the human awareness to original 3D participation and information fields) and into the original 7D (energetic probability fields) of the 2-8 Pillar. Then the process goes into the LPU 3-7D fields as these transition to the original 3-7D of the Er´Th configuration.

From 3-7D Level of the Restoration Program → 3-7D LPU → 3-7D Er´Th configuration.

Those on the Subsidiary Timeline must work to reconfigure to the original Er´Th Scheme 9-9-9 configuration of the mind field (9 rings), heart field (9 rings), and bio-field (9 rings) through vortex reconfiguration processes using the ancient Er´Th technologies in the 3rd and 7th dimensions.

We move into the *probability patterns* of regaining full access to our template as part of a larger reality-probability field transformation process under the NGC, and at the same time the overall reality field construct fully align with the Universal Matrix, which aligns the reality field configuration (atomic to quantum) with the Universal Matrix 4th and 5th dimensions.

Throughout 2028 - This part will Removed by the UM

Outer Domain 2-8 Pillar of the Restoration Programs would originally have had the possibility to continue the activation and cleanup processes of the template configurations associated with the Restoration Programs.

The process was set to move from the 4D artificial fields into original 4D (reciprocity fields) and original 6D (energetic complexity fields) of the 2-8 Pillar. Then the process goes into the LPU 4-6D fields as these transition to the original 4-6D of the Er´Th configuration.

Instead, this level will be moved into the 4D modification fields of the Universal Matrix where the remaining holocene-colonial groups will be recalibrated and offered a new 4D vessel. Once the transfer is done, the artificial 4D will collapse, the original LPU 4D will be converted and changed into UM4D. For us, at that point—around solstice 2027—we must have moved

From 4-6D Level of the Restoration Program → 4-6D LPU → 4-6D Er´Th configuration.

Those on the Subsidiary Timeline continue the work to reconfigure to the original 9D Er´Th Scheme 9-9-9 configuration of the mind field (9 rings), heart field (9 rings), and root field (9 rings) through vortex reconfiguration and ancient Er´Th technologies in the 4th and 6th dimensions.

We move into the *4D levels and holographic-energetic heart field patterns* and the work of regaining full access to our core architecture (as it is called under original 9D Er´Th Scheme 9-9-9 configuration) as part of a larger 4D-6D transformation process under the Er´Th configuration, and at the same time the overall reality field construct fully align with the Universal Matrix 4th dimension.

Throughout 2029

We continue to work with our original 9D Er´Th Scheme 9-9-9 configuration—figuring out what the core architecture actually is, and how it works. We complete the process from the artificial 5th dimensional field to the 5th dimension of the 2-8 Pillar to the LPU 5D fields as these transition the original 5D Er´Th configuration.

From 5-5D Level of the Restoration Program → 5-5D LPU → 5-5D Er´Th configuration.

Those on the Subsidiary Timeline continue the work to reconfigure to the original 9D Er´Th Scheme 9-9-9 configuration of the mind field (9 rings), heart field (9 rings), and root field (9 rings) through vortex reconfiguration and ancient Er´Th technologies in the 5th dimension meeting the midpoint of the 2-8 Pillar NGC process.

We move into the *5D levels and holographic-energetic mind field patterns* and the work of regaining access to our template as part of the original 5D to 5th cycle transformation process under the NGC, and at the same time the overall reality field fully align with the Universal Matrix 5th dimension.

From 2030 to 2034

In 2030 the bifurcation of our realty field is complete. The groups that were set to be part of the Universal Matrix are now fully integrated and will undergo further modification and adaptations. The groups that have been discarded are released from all programs and can now choose how they want to work with what is left of their templates.

The work will be immense and difficult but not impossible. The ones on the Subsidiary Timeline will continue their work within the Er´Th Scheme reconfiguration processes from the 6th dimension and into the 9th dimension.

- **2030**: Outer-Middle Domain 6D level of the original 9D Er´Th Scheme 9-9-9 configuration to be restored.
- **2031**: Outer-Inner Domain 7D level of the original 9D Er´Th Scheme 9-9-9 configuration to be restored.
- **2032**: Outer-Inner Domain 8D level of the original 9D Er´Th Scheme 9-9-9 configuration to be restored.
- **2033**: Outer-Inner Domain 9D level of the original 9D Er´Th Scheme 9-9-9 configuration to be restored.
- **2034**: Completion and entering into the work with the reconfiguration that will lead to the Safe Zones. This work will be ongoing for the rest of our lives inside this world.

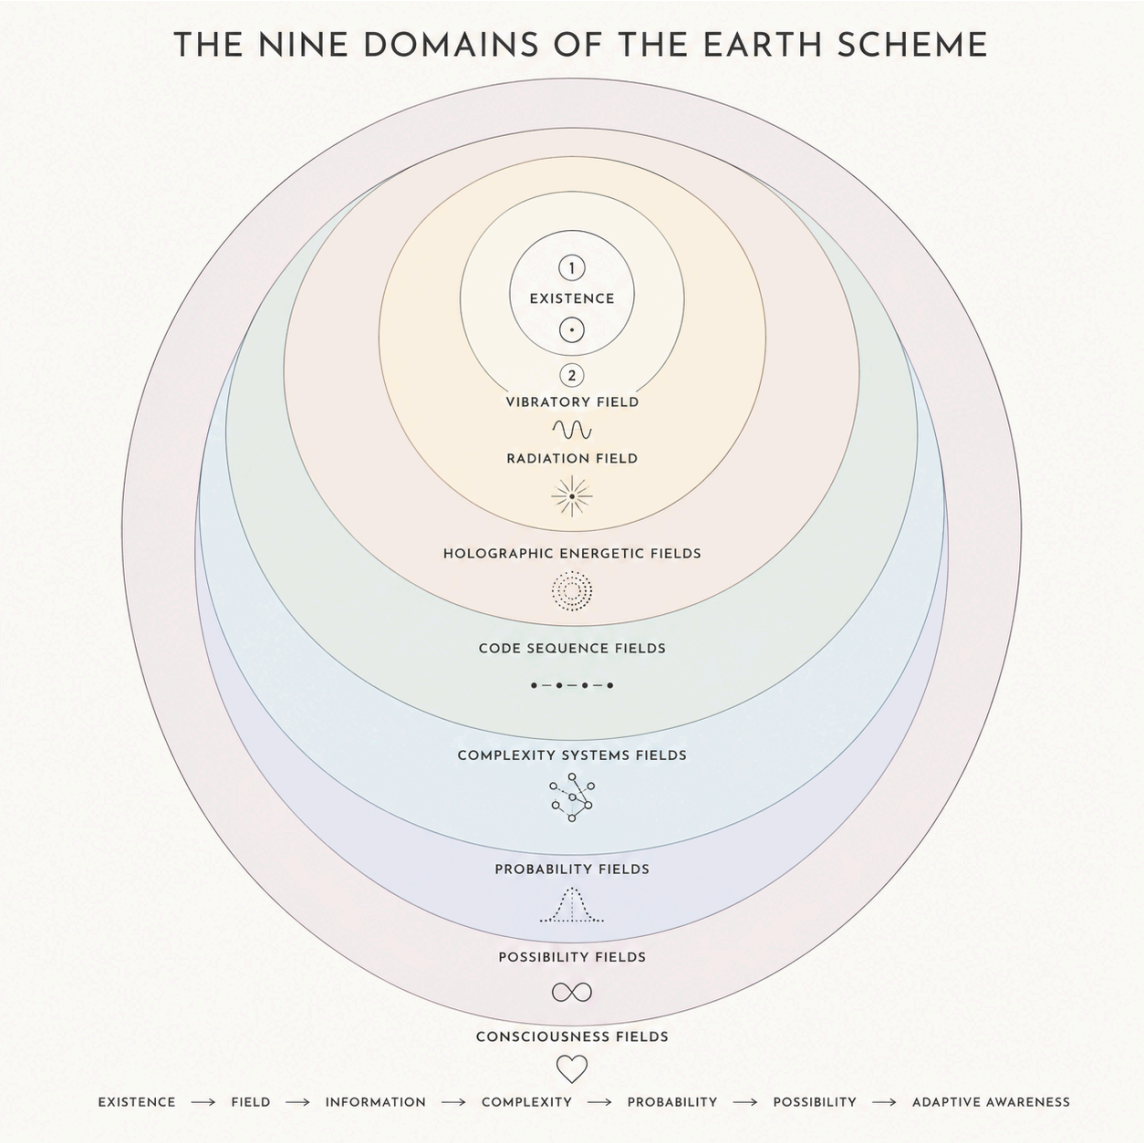
The Er´Th Scheme Configuration

Within the core architecture and its higher-order state of awareness we move towards what we could call a nine-domain scheme awareness in the years to come. It is a form of higher-order awareness that progressively becomes capable of operating across all nine domains of the Er´Th scheme rather than remaining restricted to ordinary sensory, psychological, or conceptual processing. This gives us a potential progression: *Existence → Field → Information → Complexity → Probability → Possibility → Adaptive Awareness.*

The nine domains of the Er´Th configuration can be understood as a progressively more complex level from the Holocene-colonial Earth program and into the original Er´Th scheme:

1. *Existence* — the basic condition of things being present within the Earth system.
2. *Vibratory fields* — patterns of oscillation, frequency, rhythm, and interaction.
3. *Radiation fields* — electromagnetic and other radiative exchanges moving through the system.
4. *Holographic energetic fields* — distributed patterns in which information about a larger configuration can be represented across interconnected fields.
5. *Code sequence fields* — ordered informational sequences that organize, regulate, or reproduce patterns.
6. *Complexity systems fields* — interacting networks in which simple components produce higher-order behavior.
7. *Probability fields* — the range of statistically or dynamically available outcomes from a given configuration.

8. *Possibility fields* — the larger space of what can potentially emerge, including configurations that have not yet become actual.
9. *Consciousness fields* — the Earth-compatible layer of adaptive awareness capable of perceiving, interpreting, selecting, and responding within all the preceding domains.



The nine domains provide the energies our organism and energy system need to become responsive to the information fields of the original Er´Th scheme. In the Er´Th configuration our consciousness potentials can adapt to the energetic, informational, probabilistic, and complex-system conditions of the nine Er´Th domains. This configuration is the one that enables us to complete our sequence of transformations on the subsidiary timeline.
